

Dermamelan Peel

Advanced pigmentation correction for a brighter, more even complexion.

Mesoesthetic Dermamelan Peel, an advanced depigmentation treatment designed to target stubborn pigmentation, melasma, age spots and uneven skin tone.

Dermamelan combines professional peeling and melanin suppression to help reduce the appearance of excess pigmentation and reveal a brighter, smoother and more even-looking complexion.

How It Works

The Dermamelan protocol uses a combination of active ingredients and organic acids to help reduce excess melanin production while encouraging the skin's natural renewal process.

It is particularly suited to persistent and stubborn pigmentation concerns, including melasma and chloasma.

Your Treatment

Dermamelan is a comprehensive treatment combining a professional in-clinic peel with a customised home-care protocol.

Following your in-clinic treatment, you will be provided with specialised home-care products to apply as directed in the morning and evening. This ongoing treatment is an essential part of the Dermamelan process and helps support continued pigmentation management.

What To Expect

As the skin responds to treatment, you may experience redness, dryness, tightness, sensitivity and peeling. These effects vary between individuals and are a normal part of the skin renewal process.

With consistent treatment and home care, the skin can appear **brighter, clearer, smoother and more even-toned**.

Dermamelan is suitable for a wide range of skin types, with each treatment individually assessed and tailored by Nurse Tyne.

A consultation is required to assess your skin and determine whether Dermamelan is suitable for you.
