Regenerative Skin Wellness Protocol

A personalised approach to skin health designed to support the skin's natural regenerative processes from within. Combining advanced regenerative treatments, medical-grade skincare and targeted technologies, each protocol is tailored to improve skin quality, resilience, hydration, texture and overall vitality.

Collagen-Stimulating Biostimulators

Collagen-stimulating biostimulators are designed to support the skin's natural collagen-building processes and improve overall skin quality over time. By working with the skin's own regenerative pathways, they can help enhance firmness, elasticity, texture and structural support, creating a more refreshed and naturally rejuvenated appearance.

Rejuran

Rejuran is an advanced regenerative skin treatment formulated with polynucleotides (PN) to support skin repair and renewal. It works to improve skin quality, hydration, elasticity and texture by supporting the skin's natural regenerative pathways, helping create a smoother, stronger and more revitalised complexion.

Skin Boosters

Skin boosters deliver targeted hydration and skin-rejuvenating ingredients into the dermis to improve overall skin quality. Designed to enhance hydration, elasticity, luminosity and texture, they are ideal for skin that appears dry, dull, crepey or fatigued, creating a naturally refreshed and healthy-looking complexion.

SkinPen Microneedling

SkinPen microneedling uses precision-controlled micro-injuries to stimulate the skin's natural healing response and encourage collagen and elastin production. This minimally invasive treatment can improve the appearance of fine lines, uneven texture, enlarged pores and acne scarring, leaving skin smoother, firmer and more refined.

Exosome Therapy

Exosome therapy uses regenerative signalling molecules to support skin renewal and recovery. Applied alongside advanced skin treatments, exosomes can help support the skin's natural repair processes while improving the appearance of texture, tone, hydration and overall skin vitality.

PRP

Platelet-Rich Plasma (PRP) uses concentrated components derived from your own blood to support the skin's natural healing and regenerative processes. Rich in growth factors, PRP is designed to encourage cellular renewal and collagen production, helping improve skin quality, texture, firmness and radiance.

Dermamelan Peel

Dermamelan is a professional depigmentation treatment designed to target stubborn pigmentation concerns, including melasma and uneven skin tone. The treatment works to reduce the appearance of excess pigmentation while supporting a brighter, more even and luminous complexion, with a personalised home-care protocol to maintain results.

LED Light Therapy

LED light therapy is a gentle, non-invasive at home treatment that uses specific wavelengths of light to support healthy skin function. It can help calm visible redness and inflammation, support skin recovery and promote a healthier-looking complexion, making it an ideal standalone treatment or complement to regenerative skin therapies.

Concerns

Fine Lines & Wrinkles

A personalised approach to softening the appearance of fine lines and wrinkles while supporting long-term skin quality. Treatment may combine regenerative therapies, collagen stimulation, skin boosters and advanced skincare to restore smoother, firmer and more youthful-looking skin.

Collagen Support

Collagen production naturally declines with age, contributing to thinner, less resilient and less elastic skin. Regenerative treatments can help stimulate the skin's own collagen-building processes, supporting improved firmness, texture and long-term skin quality.

Facial Sagging

Facial sagging is often influenced by changes in collagen, elastin, skin quality and underlying facial support. Our approach focuses on restoring structure and stimulating regeneration to improve firmness, definition and overall facial harmony without compromising natural expression.

Facial Contour

Ageing can lead to gradual changes in facial volume and structural support. A tailored treatment approach can restore balance and proportion while supporting collagen production, helping to create a refreshed and naturally rejuvenated appearance.

Cheek Volume Loss

Loss of cheek volume can contribute to a flatter mid-face and changes in facial contour. Treatment can be designed to restore subtle support and definition while maintaining natural proportions and enhancing overall facial harmony.

Jawline Definition

A defined jawline is influenced by facial structure, skin laxity, soft tissue and volume distribution. Personalised treatment can enhance definition and support the lower face, creating a more sculpted and balanced appearance.

Chin Definition

The chin plays an important role in facial balance and profile harmony. Targeted treatment can improve chin projection, proportion and definition while complementing the natural structure of the lower face.

Temple Hollowing

Temple hollowing is a common feature of facial ageing and can contribute to a more gaunt or tired appearance. A considered approach can restore subtle volume and support to the temples, helping create a softer and more harmonious facial contour.

Under-Eye Hollowing

Changes in volume, skin thickness and collagen around the eyes can create a hollow or tired appearance. Treatment is carefully tailored to the individual to support the delicate under-eye area and restore a more rested, refreshed appearance.

Brow Sagging

Changes in skin elasticity, collagen and facial support can contribute to brow descent and a heavier upper-face appearance. Treatment can focus on improving skin quality and supporting the surrounding structures to create a more refreshed and open-looking upper face.

Skin Longevity

Cellular ageing affects the skin's ability to regenerate, repair and maintain healthy collagen and elastin production. Our regenerative approach is designed to support cellular health and the skin's natural renewal processes, with a focus on long-term skin vitality rather than simply treating visible signs of ageing.

Dehydrated Skin

Dehydrated skin can appear dull, tight, rough and more prone to visible fine lines. Targeted skin treatments and medical-grade skincare can replenish hydration, strengthen the skin barrier and restore a healthier, more luminous complexion.

Neck Rejuvenation

The neck is particularly susceptible to collagen loss, skin laxity, dehydration and visible lines. A tailored regenerative approach can improve skin quality, hydration and firmness while supporting a smoother, more refined appearance.

Excessive Sweating

Excessive sweating, or hyperhidrosis, can significantly impact comfort and confidence. Targeted treatment can temporarily reduce excessive sweating in areas such as the underarms, hands or feet, helping patients feel more comfortable and confident in everyday life.
